

FROMDEV

25+ Liferay Interview Questions and Answers for Portal D

<http://www.fromdev.com/2013/08/Liferay-Portal-Question-Answer.html>

Liferay is one of the most popular JSR compliant open source portal. This can be used to drive mu and feel. Liferay is developed in Java and the major portlet development on it is also supported by

The latest releases of liferay has been really feature rich and seen a increasing demand in liferay c websites using single liferay server installation is one of the main reason of liferay gaining populari

Liferay jobs are really high paying jobs due to being specialized in portlet segment of java web app portals available with free and paid options. To be highly valuable developer you must focus your k development, this will ensure you can do development on any other JSR comliant portal as well.

Another positive aspect of Liferay portlet development is "The Liferay marketplace", this can give y portlet to big businesses and grow your own business.

I have worked on liferay for more than 5 years and found that following interview questions are mu developer job.

What is a Liferay Portal?

In general, a web portal represents a web application that provides a single point of access to various

Functionality of a portal can be extended very easily by creating custom applications that can run inside portlets.

For running portlets you need an application server that can run a portlet container spec (JSR168 or) or enterprise portal products available.

Liferay portal is an open source portal and below are the benefits of using Liferay portal:

- Content management system (Documents, Articles).
- 2-stage, 3-stage workflows and publishing.
- Social networking.
- 4) Sites and organization basis pages.
- Integration with third party like LDAP, Solr, SSO (CAS, Siteminder).
- Portlets related to Wiki's, News, Finance, Social, Workflow, Collaboration.
- Compatible with different Operating systems, databases and APP servers.
- Compatible with UI technologies and web services.
- Compatible with different scripts like PHP, Ruby, Grails, Python.
- Support of hot deployment feature.

What is a Portlet?

Liferay portal comes with different portlets by default. These portlets are nothing but different small Portlets are pluggable software components that are managed in a web portal.

In general words you can call them as different catalogues as portlets produce fragments of markup. A portal page is displayed as a collection of portlets, these multiple small applications together make together makes one community or enterprise portal. Hence a portlet (or collection of portlets) resides in a portal.

Portlet is a small application to fulfill the requirement of certain domain. Inter portlet communication supports the hot deployment feature of Liferay Portal.

What is the difference between Hook, EXT and Portlet?

Liferay provides 3 ways to extend the functionality of a Liferay portal. Each of the ways fits its good fit

Hook

Liferay portal comes with a bundle where all the default built in portlets exist. Typically if any custom portal properties. We need to go by Hook implementation. Hook is supported by hot deployment. Whenever possible, hooks should be used in place of Ext plugins, as they are hot-deployable and

Some common scenarios that require the use of a hook are

- When you have to perform a custom action on portal startup
- When you have to perform a custom action on user login
- When you need to overwrite or extend portal JSPs
- When you need to modify portal properties
- When you need to replace a portal service with your own implementation.

EXT

Liferay EXT Plugins are the most powerful way to extend the portal functionality. If any customization be done through EXT for example LDAP users and user groups import modification. but here in EXT

EXT Plugins should be used only in case the portal functionality can not be extended using Portlet development and may cause maintenance issues in case you are trying to upgrade.

From liferay documents, The main use cases in which an Ext plugin may be used are:

-
- Customizations to portal.properties (that is not supported by Hook Plugins)
 - Customizing and making changes to the Struts Actions for portal
 - Customizations of the Liferay beans declared in Liferay's Spring files
 - Adding JSPs that are referenced from portal properties that can only be changed from an ext plugin (be sure to check if it before doing this)
 - Direct overwriting of a class (not recommended unless it's strictly necessary)

Portlet

Portlets are the most common and easiest way to extend and provide a custom functionality for a portal the requirement of certain domain. It is basically a bunch of code (Java Files, JSP, CSS, JavaScript) deployment.

Liferay also has a marketplace where a lot of useful portlets are available for download and these |
We recently contributed a [Speed reading portlet](#) and a [My IP Address portlet](#) in this marketplace for

What JSR version Liferay implements? Why JSR compatibility is important while choosing

JSR is a "Java Specification Request". Liferay Portal is developed to adhere to JSR 168 and JSR 2
This specification is created by committee of JEE portal vendors. This specification is designed to c
portals and portlets.

Liferay supports mainly below JSRs.

JSR-168(Portlet 1.0)

JSR-286(Portlet 2.0)

JSR-127(JSF 1.0)

JSR-170

JSR-314(JSF 2.0)

JSR-329

Why these standards are defined?

These standards are defined for the benefit of portal users (end customers). Before these standard
use one portal and there was no easy way to switch between different portal vendors. Earlier porta
were developed using proprietary API, technology and programming techniques. The JSR 168 and
portlets can be developed that will help users in long run.

Benefits of Following JSR Standards

Following these standards will ensure that there is no vendor lock in. However this can be guarant
sticking to the standards.

What is a Portlet Lifecycle?

Following is the portlet lifecycle:

- `init()`: It mainly initializes the portlet.
- `render()`: It takes the HTML output to User Interface. It mainly render the view in term of JSP/ portlet.
- `Destroy`: This method takes care of releasing the portlet resources.

What Is The Difference Between View Mode And Edit Mode Of Portlets?

The modes of a portlet are typically related to the types of operations a user can perform on the page to do read only operations, whereas in edit mode user can add/update the data in the portlet.

Each portlet mode has a method which handles it:

`doView()`

`doEdit()`

`doHelp()`

These methods will contain mainly our "traffic directing" logic, which are responsible to decide where

Once the view has been determined, we will forward on to methods which actually implement that. For standard portlet view modes have two views:

- The default view which shows the list of items.
- The form, where users will mainly do the add and edit action.

In this where end user can edit the particular item, is called edit mode of portlet.

What Is A Liferay Theme? What Are The Advantages Of Using Them?

Liferay themes are the way to customize look and feel of a liferay portal page. The themes are extended separately on a portal and each page on the portal can choose a different theme (if required).

Themes are really powerful way to run multiple websites from a single portal. You can host multiple different look and feel. This allows you to be unique at the same time save a lot resources on web.

A lot of companies use liferay for creating multiple unique websites with the help of extraordinary themes.

Themes are also available from marketplace.

For developing on our own, we have option of using VM pages (Velocity templates). Liferay provides the portal same like portlets war files. So number of themes we can be deployed into Liferay portal.

user interface as per the requirement of end user for different site or organization pages.

How To Use LDAP Authentication With Liferay?

LDAP is lightweight directory access protocol that is most commonly used for authentication and a users and usergroups of any organization with certain search filter like DN entries. In the control panel, you can configure LDAP settings so that portal can contact the third party like LDAP and fetch the required users and groups.

For example Active directory is a LDAP implementation which can store users. Liferay support integration with Active directory through its admin control panel.

We need to provide the settings in control panel - > portal settings -> LDAP

This will require LDAP URL, username, password, users search filters mappings, groups search filter.

What Is Portal-ext.properties File? How This Can Be Configured And Used In Liferay?

Liferay Portal comes with default configurations that are stored in portal.properties file. You can use this file to override the default configurations in portal-ext.properties file.

This allows you a clean way to keep your own copy of configurations that can be used outside the portal.

What Is Inter-portlet Communication? Why Is It Required To Use JSR Style Inter-portlet Communication?

Sometimes we have the requirement where we need to establish communication in between two portlets. One portlet is redirecting the end user to other portlet where some kind of result is displaying as per action.

So in this use case we have to use liferay inter-portlet communication mechanism which serve the action and provide the result to the second portlet where the action result needs to be displayed. We can use JSR style inter portlet communication mechanism.

JSR style inter portlet communication ensures that your portlets are going to work on any other JSR specific way to communicate between portlets than you may not be able to deploy and run the same portlets on (e.g. Apache Pluto)

What Is A Liferay Portal Instance?

Liferay portal ships with the one liferay portal tomcat bundle which is up and running in any server. You can have more than one liferay instances running from one database.

Liferay Portal allows you to run more than one portal instance on a single server. The Portal Instance manages these instances. Data for each portal instance are kept separate. All portal data, however, is kept in the database.

Each portal instance requires its own domain name. Liferay will direct users to the proper portal instance when you configure an instance, we need to configure its domain name in our network first. When we are in the Add tab - > Add button.

It will be prompted for four fields and a check box:

- **Web ID:** A general convention is to use the domain name for this. It's a user-generated ID for the instance.
- **Virtual Host:** Put the domain name you configured in your network here. When users are directed to the domain name, Liferay will then be able to send them to the proper portal instance.
- **Mail Domain:** Enter the domain name for the mail host for this instance. Liferay will use this to send email.
- **Max Users:** Enter the maximum numbers of user accounts you would like your portal instance to have.
- **Active:** Use this check box to choose whether to create an active or an inactive portal instance.

Now we need to click Save. Now navigate to the portal using new domain name. We will see that the new portal instance which can now be up and running.

How Can I Configure Two Different Domain Names (e.g. First.example.com And Second.example.com)?

At the time of creation of any site we need to provide domain names which further take it as site default domain name as required through the control panel of liferay portal. Single instance of Liferay Portal can support multiple domain names via communities/sites).

When we will go to control panel -> Site settings -> we can provide the site URL, details like site configuration, status and virtual host.

How Can I Configure Liferay To Use Email Address As User Name Instead Of Screen Name?

We can set this from control panel -> portal settings -> Authentication -> LDAP -> How do users authenticate? -> require from email address, screen name or user ID. At the time of LDAP authentication, we need to configure LDAP settings. Basically reads all the details related to users and usergroups from LDAP directory and import into Liferay. If we are using third party we need to give the required field like authentication should be by email address or screen name.

How To Customize The Behavior Of Liferay Default Out Of The Box Portlets (e.g. Document Library, News, etc.)

If we need any customization, related to JSP and UI then we can implement this using Hooks. Liferay has many default built in portlets exist. If any customization required in the core level classes then it can be customized by overriding the user groups import modification. but here in EXT, restart would be required.

What Is Liferay Service Builder? Is There Any Alternative To Use Service Builder? What Are Using It?

Liferay service builder is basically used to create the service layers for any business logic implementation. It is helpful as it is used to create all the service layers automatically. Suppose we want to develop a portlet, implementation classes, utility classes and other required classes. Service builder is used to create them. We can add their business logic further and process the data and render the output to view as per the requirement.

As per the advantage, this service builder will create the whole structure of the service layers for development. Code and their logic in service builder created model implementations and service implementations. CRUD (create, update and delete) operations. For developer, no need to add anything extra as what is created by service builder. It really speeds up the development process.

Service builder requires service.xml which is having some of the required entries. Each of the entry has primary key fields with some other required fields. If we want to implement order and finder methods in service.xml.

Each entity creates a table into Liferay configured database with the given column names and their types. We can enable service and remote-service by setting their value as "true". When we would run this build-service command, it will create the service layers (implementation, utility etc.) where developer can write their required business logic further. If we want to do this by the build.xml, we need to build-services using this xml file into Ant view of IDE.

How To Set The Display Category Of A Custom Built Liferay Portlet ?

We can set the display category like below mentioned liferay-display.xml. Suppose we have developed a custom built liferay portlet. We need to enter the custom built liferay portlet into certain category like name "category.cms". This custom built liferay portlet would come in required category by clicking the add application feature portlets under different categories. So below tag we need to enter for the entry of a portlet into certain category.

```
<display>
<category name="category.cms">
<portlet id="20" />
</category>
</display>
```

How To Support Internationalization (i18n) On Liferay Portlets? How Do You Support Multiple Languages On Liferay?

We can support internationalization (i18n) on Liferay portlets and through out this whole Liferay portal need to support into Liferay portal. This is mainly reads the regions number and provide the available SG(singapore), zh_CN(simple chinese), zh_TW(traditional chinese), ja_JP(Japanese).

In the same way to provide support of multiple languages without writing java code in Liferay, we can use portlet, hooks and themes. This entry we can provide into same portal-ext.properties which Liferay translation accordingly.

```
locales=en_US,zh_CN,zh_TW,ja_JP,ko_KR
```

If we are writing some custom messages in our code then we need to provide the below property file of Locales would convert it accordingly. We can use LocaleUtil in our code which will convert the code.

For example we want the assetCategory title in multi languages then we need to use this assetCategory we have mentioned earlier would be in action and pick the given title name from certain locale relation.

```
Language_en_US.properties
```

```
Language_zh_CN.properties
```

```
Language_zh_TW.properties
```

What Are The Advantages Of Using Tomcat Bundle Of Liferay Against Other App Servers (e.g., JBoss)?

It is possible to use Liferay with Liferay IDE with other than tomcat server bundles but there are some advantages available:

- Native eclipse server adapter that supports launching and debugging.

- Deployment via add/remove modules wizard would not be available.

- Auto redeployment based on changes to project resources.

Which One Is Best To Start In A Clean Setup?

Liferay bundle with tomcat app server is the best one to start in a clean setup.

How Do You Perform Junit Tests On Your Portlet?

Junit tests are there to check the code mainly by providing the value of any method input parameter.

values.

```
public class MyEmployeeTest {
    ClassPathXmlApplicationContext context = new ClassPathXmlApplicationContex
        "ApplicationContext-service.xml");
    public void testMyMethod() {
        UserService employeeService = (UserService) context.getBean("userService")
        //Provide the user Id as 101581
        User user = storeService.findUserByUserId(1234);
        //get the employee
        Set employee = user.getEmployeesForUserId();
        System.out.println("Employee Name : "+employee.getName());
    }
}
```

How Will You Configure A Portlet That Can Be Added Multiple Times On A Portal Page?

One property is there in portlet.xml which is as follows:

```
<instanceable>true</instanceable>
```

by using the value true and false we can configure a portler that can be added multiple times on a

How Can You Customize Liferay Search Feature? What Are The APIs To Do It?

We can customize Liferay Search feature, depends upon our requirement by below two ways.

Hook : If changes are required as per the view side like we need to change the search result form to customize it.

EXT : If changes are required as per the core functionality like we need to change the search quer

How Can You Integrate Liferay With An External Content Management System (e.g. Alfresco)

Liferay passes user credentials through CMIS to the alfresco in order to connect. To enable this in property in portal-ext.properties which will allow liferay to store password in session.

```
session.store.password=true
```

Also one more thing we need to take into consideration is that Liferay passes logged in user's cred here) as described above. What this means is that userid/password in liferay must match userid/p loginid (which is similar to screen-name in liferay) to authenticate user. So we need to make liferay making following entry into portal-ext.properties.

```
company.security.auth.type=screenName
```

So we need to start Liferay. Login as administrator and go to control panel. we need to go to Docu where we need to click on Add -> New Repository. this will bring one screen where we basically pr like below.

Name: Give any name you want to give to your repository view in liferay. For example, I will give All Description: A brief description about it.

Repository Type: We can connect either using AtomPub or using web services.

AtomPub URL: This will be the CMIS repository URL where our alfresco is running. In our case, it's /api/cmisis (Note: In case of Alfresco 4.0, it will be http://host:port/alfresco/cmisisatom).

Repository ID: It is basically used to connect to a specific repository incase we have multiple repos repositoryId, then it will just look for the first repository using the given parameters and set it to tha

How To Setup A Liferay Cluster From Scratch?

We need to setup below properties in our portal-ext.properties(this is for one instance represented second instance also represented by 2p) and some required IP addresses.

```
#cluster configurations - these settings are for cluster
net.sf.ehcache.configurationResourceName=/myehcache/hibernate-clustered.xml
dl.store.file.system.root.dir=/webapps/document_library_cluster
#other settings for cluster
liferay.home=/webapps/liferay-1p/liferay-portal-6.1.10-ee-ga1/
lucene.dir=/webapps/liferay-1p/liferay-portal-6.1.10-ee-ga1/data/lucene
cluster.link.enabled=true
lucene.replicate.write=true
multicast.group.address["cluster-link-control"]=239.255.4.1
```

How To Use AUI In Liferay? What Are The Advantages Of Using It In Liferay Instead Of JQuery?

AlloyUI (AUI) is Liferay's open-source javascript library. It is built on Yahoo User Interface (YUI) and javascript functions specifically designed for portlets. As it is Liferay provided JS library here no ne advantage of and incorporate patterns from the best libraries to make building robust and flexible \ CSS framework, a set of HTML recipes and a taglib library, all combined to empower developers at dynamic applications. Only we need to add certain tag library like below in order to use Liferay Allc

```
<taglib>
    <taglib-uri>http://liferay.com/tld/au</taglib-uri>
    <taglib-location>/WEB-INF/tld/liferay-ai</taglib-location>
</taglib>
```

So further we can use these all form and fields like below in our JSP code.

```
<au<form>
    <au<input name="Name" size="45" />
</au</form>
```

How To Use JQuery In Liferay?

We need to provide the entry like below in our JSP files. So that it can read the provided java scrip accordingly.

```
<script type="text/javascript" src="<%=themeDisplay.getPathThemeCss()%>/../
```

How To Configure Liferay To Use A JNDI JDBC Datasource Instead Of Internal C3p0 Connect

We need to do the entry of perticular resource with some certain parameter like name, factory, driv password.

Below is the entry of resource where JDBC datasource is configured.

```
<Resource type="javax.sql.DataSource"
    name="jdbc/LiferayPool"
    factory="org.apache.tomcat.jdbc.pool.DataSourceFactory"
    driverClassName="com.mysql.jdbc.Driver"
    url="jdbc:mysql://<IP-Address>/<database_name>?autoReconnect=true&us
    username="liferay"
    password="0bknSWE2zzl"
    initialSize="10"
    maxActive="200"
    minIdle="0"
/>
```

Below is the entry of resource where c3p0.ComboPooledDataSource is configured.

```
<Resource
    name="jdbc/LiferayPool"
    auth="Container"
    type="com.mchange.v2.c3p0.ComboPooledDataSource"
    factory="org.apache.naming.factory.BeanFactory"
    driverClass="com.mysql.jdbc.Driver"      jdbcUrl="jdbc:mysql://<server-IP
    user="liferay"
    password="0bknSWE2zzl"
    minPoolSize="10"
    maxPoolSize="100"
/>
```

I hope you find this list useful. Are you a Liferay developer? Feel free to suggest any questions we
